Summary

DeHacker's objective was to evaluate the repository for security-related issues, code quality, and adherence to specification and best practices. Possible issues we looked for included (but are not limited to):

- Transaction-ordering dependence
- Timestamp dependence
- Mishandled exceptions and call stack limits
- Unsafe external calls
- Integer overflow/underflow
- Number rounding errors
- Reentrancy and cross-function vulnerabilities
- Denial of service/logical oversights
- Access control
- Centralization of power
- Business logic contradicting the specification
- Code clones, functionality duplication
- Gas usage
- Arbitrary token minting

Issue Categories

Every issue in this report was assigned a severity level from the following:

Critical severity issues

A vulnerability that can disrupt the contract functioning in a number of scenarios or creates a risk that the contract may be broken.

Major severity issues

A vulnerability that affects the desired outcome when using a contract or provides the opportunity to use a contract in an unintended way.

Medium severity issues

A vulnerability that could affect the desired outcome of executing the contract in a specific scenario.

Minor severity issues

A vulnerability that does not have a significant impact on possible scenarios for the use of the contract and is probably subjective.

Informational

A vulnerability that has informational character but is not affecting any of the code.

Overview

Project Summary

Project Name	TARS Protocol
Platform	BSC
website	https://tars.pro/
Type	DeFi Infrastructure
Language	Solidity

Major

GLOBAL-01 | Centralization Related Risks

Category	Severity	Location	Status
Centralization / Privilege	Major		Acknowledged

Description

In the contract `CoinSalesIDO`, the role `superAdmin` has the authority over the following function:

- function `adminSafeTransfer()`
- function `updateInsuranceAddress()`
- function `updateIsPrivate()`
- function `updateTime()`
- function `updatePoolQuota()`
- function `updateQuantitySold()`
- function `updateWhiteListQuota()`
- function `addWhiteList()`
- function `addLockWarehouse()`
- function `updateSellingToken()`
- function `updateSellingTokenName()`
- function `cancelProject()`
- function `identification()`
- function `transferCoin()`

In the contract `CoinSalesIDO`, the role `secondParty` has the authority over the following function:

- function `addWhiteList()`
- function `addLockWarehouse()`
- function `updateSellingToken()`

- 4. function updateSellingTokenName()
- 5. function cancelProject()
- 6. function secondPartyClaim()

In the contract `CoinSalesIDO`, the role `firstParty` has the authority over the following function:

- function identification()
- function transferCoin()
- function firstPartyClaim()

In the contract `FactoryIDO`, the role `superAdmin` has the authority over the following function:

- function adminSafeTransfer()
- function updateAdmin()
- function updateInsurance()
- function updateAssemblyLine()
- function addAssemblyLine()
- function deleteAssemblyLine()

In the contract `FactoryIDO`, the role `voucherBoss` has the authority over the following function:

- function updateProxyInvestment()
- function foundCoinSalesIdo()
- function customProductionIDO()

In the contract `FactoryIDO`, the role `operator` has the authority over the following function:

- function updatePayee()
- function updateBusinessToken()
- function updatePrice()
- function updateClosePrice()
- function addFundRaisingToken()
- function deleteFundRaisingToken()
- function poolAuthentication()

In the contract `Insurance`, the role `superAdmin` has the authority over the following function:

- function adminSafeTransfer()
- function updateAdmin()

- 3. function setFactoryIdAddress()

In the contract `Insurance`, the role `operator` has the authority over the following function:

- function adminAllSafeTransfer()
- function updateInsuranceRate()
- function settlementOfClaims()

In the contract `VoucherNft`, the role `operator` has the authority over the following function:

- function setNftUri()
- function mintNft()

Any compromise to the accounts may allow a hacker to take advantage of this authority and causes security problems.

Recommendation

The risk describes the current project design and potentially makes iterations to improve in the security operation and level of decentralization, which in most cases cannot be resolved entirely at the present stage. We advise the client to carefully manage the privileged account's private key to avoid any potential risks of being hacked. In general, we strongly recommend centralized privileges or roles in the protocol be improved via a decentralized mechanism or smart-contract-based accounts with enhanced security practices, e.g., multi-signature wallets.

Indicatively, here are some feasible suggestions that would also mitigate the potential risk at a different level in terms of short-term, long-term and permanent:

Short Term:

Timelock and Multi sign ($\frac{2}{3}$, $\frac{3}{5}$) combination mitigate by delaying the sensitive operation and avoiding a single point of key management failure.

- Time-lock with reasonable latency, e.g., 48 hours, for awareness on privileged operations;
AND

- Assignment of privileged roles to multi-signature wallets to prevent a single point of failure due to the private key compromised;
AND
- A medium/blog link for sharing the timelock contract and multi-signers addresses information with the public audience.

Long Term:

Timelock and DAO, the combination, mitigate by applying decentralization and transparency.

- Time-lock with reasonable latency, e.g., 48 hours, for awareness on privileged operations;
AND
- Introduction of a DAO/governance/voting module to increase transparency and user involvement;
AND
- A medium/blog link for sharing the timelock contract, multi-signers addresses, and DAO information with the public audience.

Permanent:

Renouncing the ownership or removing the function can be considered *fully resolved*.

- Renounce the ownership and never claim back the privileged roles;
OR
- Remove the risky functionality.

Noted: Recommend considering the long-term solution or the permanent solution. The project team shall make a decision based on the current state of their project, timeline, and project resources.

Alleviation

The team response: Some permissions have been cancelled, and the remaining permissions are due to business needs.

GBI-01 | Missing Validation

Category	Severity	Location	Status
Logical Issue	Major	CoinSalesIDO.sol: 418~427, 429~431	Resolved

Description

The `sellingToken` can be changed after `startTime`. So `sellingToken` can be changed after the user hamade a purchase. The user may not get the `sellingToken` that he wanted to buy.

Recommendation

We recommend adding a check to ensure the `sellingToken` can only be changed before `startTime`.

Alleviation

The development team has resolved this issue in commit `a38539d19c200c900888315ad35dcd9acf938470`.

GSI-01 | Permission Issues For Super Admin

Category	Severity	Location	Status
Logical Issue	Major	FactoryIDO.sol: 150~154; Insurance.sol: 111~116	Resolved

Description

The function `updateAdmin` can only be called by the `superAdmin`. The functions `removeAuth` and `addAuth` can only be called by the owner. But the `superAdmin` is set in `constructor`, maybe not the `owner`. So the `superAdmin` may not have the permission to call the functions `removeAuth` and `addAuth`.

Recommendation

We recommend assigning owner to `superAdmin` in `constructor`.

Alleviation

The development team has resolved this issue in commit `a38539d19c200c900888315ad35dcd9acf938470`.

VST-01 | Missing Creation In Function `queryUserAllNft`

Category	Severity	Location	Status
Logical Issue	Major	token/VoucherNft.sol: 74~79	Resolved

Description

In function `queryUserAllNft`, `nftArray` is not created. When this method be called there will be an error.

Recommendation

Consider modifying as below:

```
1  nftArray = new NftInfo[](_ids.length);
2  for (uint256 i = 0; i < _ids.length; i++) {
3      nftArray[i] = nftInfo[_ids[i]];
4  }
5  return nftArray;
```

Alleviation

The development team has resolved this issue in commit `a38539d19c200c900888315ad35dcd9acf938470`.

Medium

IOP-01 | Possible Loss Of Accuracy In Function `joinInsurance`

Category	Severity	Location	Status
Logical Issue	Medium	Insurance.sol: 169, 172	Resolved

Description

Variables `totalInsuredAmount`, `userInsuredTotal` are without precision. The default value of `insuranceRate` is 1%. When the investment amount is not an integer multiple of 100, `totalInsuredAmount` and `userInsuredTotal` will have a loss of precision.

For example: `_investedAmount = 99 * 10 ** decimals`; `_amount = 0.99 * 10 ** decimals`; `_amount.div(10 ** decimals) = 0`;

Recommendation

We recommend retaining the precision of `totalInsuredAmount` and `userInsuredTotal`.

Alleviation

The development team has resolved this issue in commit `a38539d19c200c900888315ad35dcd9acf938470`.

IOP-02 | Incorrect Operator Used

Category	Severity	Location	Status
Logical Issue	Medium	Insurance.sol: 169, 172	Resolved

Description

```
1    totalInsuredAmount = totalInsuredAmount.add(_amount.div(10 * decimals));
2
3    userInsuredTotal[_user] = userInsuredTotal[_user].add(_amount.div(10 *
decimals));
```

The operator in Line 169 and Line 172 should be **, but not *.

Recommendation

We recommend using the correct operator.

Alleviation

The development team has resolved this issue in commit [a38539d19c200c900888315ad35dcd9acf938470](#).

IOP-03 | Inadequate Validation

Category	Severity	Location	Status
Logical Issue	Medium	Insurance.sol: 150~179	Resolved

Description

The validation in `Insurance.joinInsurance` is not sufficient. Users can forge their own contracts into `CoinSalesIDO` to mint themselves NFT.

Recommendation

We recommend using of more adequate calibration `FactoryIDO.isVoucherIdo(msg.sender)` to ensure the `CoinSalesIDO` is a valid one.

Alleviation

The development team has resolved this issue in commit `a38539d19c200c900888315ad35dcd9acf938470`.

Minor

GBI-02 | Missing Input Validation

Category	Severity	Location	Status
Volatile Code	Minor	CoinSalesIDO.sol: 264~265	Resolved

Description

The `userFloor` means the minimum amount of tokens one user can buy. The `userQuota` means the maximum amount of tokens one user can buy. So the `userFloor` should be less than `userQuota`.

Recommendation

Consider adding a check as below:

```
1    require(intArr[7] > intArr[8], "userQuota should be greater than userFloor!");
```

Alleviation

The development team has resolved this issue in commit `a38539d19c200c900888315ad35dcd9acf938470`.

GBI-03 | Lack Of Reasonable Boundary

Category	Severity	Location	Status
Volatile Code	Minor	CoinSalesIDO.sol: 277, 372~416	Partially Resolved

Description

1. The variable `yield` means the percentage a second party can get from a `CoinSalesIDO`. Its current range values is `yield<=100`. We think its range of values should be more reasonable.
2. If `_isLockWarehouse == 2`, the selling token may be locked for a certain period of time. This time should be within a reasonable range.

Recommendation

We recommend adding reasonable upper and lower boundaries to all the configuration variables.

Alleviation

1. The range of values changed to `0<yield<100`.
2. The final unlock time limit is 10 years after the current time.

Code was applied in commit `a38539d19c200c900888315ad35dcd9acf938470`

GSI-02 | Missing Input Validation

Category	Severity	Location	Status
Volatile Code	Minor	AssemblyLine.sol: 20, 25; CoinSalesIDO.sol: 420; FactoryIDO.sol: 99, 102~106, 152; Insurance.sol: 61~63	Acknowledged

Description

The given input is missing the check for the non-zero address.

Recommendation

We advise adding the check for the passed-in values to prevent unexpected error as below:For example:

```
1    require(_lineLeader != address(0), "lineLeader can not be zero address!");
```

Alleviation

The team response: No need to resolve.

Informational

GBI-06 | Condition Can Be Simplified

Category	Severity	Location	Status
Volatile Code	Informational	CoinSalesIDO.sol: 481	Resolved

Description

In Line481, `_amount <= investment.add(_amount)` . So Line481 can be simplified.

Recommendation

Consider adding a check as below:

```
1    require(investment.add(_amount) <= quota, "Err_46");
```

Alleviation

The development team has resolved this issue in commit `a38539d19c200c900888315ad35dcd9acf938470`.

GSI-03 | Unlocked Compiler Version

Category	Severity	Location	Status
Language Specific	Informational	AssemblyLine.sol: 2; token/VoucherNft.sol: 2; CoinSalesIDO.sol: 2; Insurance.sol: 2; FactoryIDO.sol: 2	Acknowledged

Description

The contract has unlocked compiler version. An unlocked compiler version in the source code of the contract permits the user to compile it at or above a particular version. This, in turn, leads to differences in the generated bytecode between compilations due to different compiler versions. This can lead to an ambiguity when debugging as compiler specific bugs may occur in the codebase that would be hard to identify over a span of multiple compiler versions rather than a specific one.

Recommendation

We advise that the compiler version is instead locked at the lowest version possible that the contract can be compiled at. For example, for version v0.6.2 the contract should contain the following line:

```
pragma solidity 0.6.2;
```

Alleviation

The team response: No need to resolve.

Disclaimer

This report is based on the scope of materials and documentation provided for a limited review at the time provided. Results may not be complete nor inclusive of all vulnerabilities. The review and this report are provided on an as-is, where-is, and as-available basis. You agree that your access and/or use, including but not limited to any associated services, products, protocols, platforms, content, and materials, will be at your sole risk. Blockchain technology remains under development and is subject to unknown risks and flaws. The review does not extend to the compiler layer, or any other areas beyond the programming language, or other programming aspects that could present security risks. A report does not indicate the endorsement of any particular project or team, nor guarantee its security. No third party should rely on the reports in any way, including for the purpose of making any decisions to buy or sell a product, service or any other asset. To the fullest extent permitted by law, we disclaim all warranties, expressed or implied, in connection with this report, its content, and the related services and products and your use thereof, including, without limitation, the implied warranties of merchantability, fitness for a particular purpose, and non-infringement. We do not warrant, endorse, guarantee, or assume responsibility for any product or service advertised or offered by a third party through the product, any open source or third-party software, code, libraries, materials, or information linked to, called by, referenced by or accessible through the report, its content, and the related services and products, any hyperlinked websites, any websites or mobile applications appearing on any advertising, and we will not be a party to or in any way be responsible for monitoring any transaction between you and any third-party providers of products or services. As with the purchase or use of a product or service through any medium or in any environment, you should use your best judgment and exercise caution where appropriate.

FOR AVOIDANCE OF DOUBT, THE REPORT, ITS CONTENT, ACCESS, AND/OR USAGE THEREOF, INCLUDING ANY ASSOCIATED SERVICES OR MATERIALS, SHALL NOT BE CONSIDERED OR RELIED UPON AS ANY FORM OF FINANCIAL, INVESTMENT, TAX, LEGAL, REGULATORY, OR OTHER ADVICE.

Appendix

Finding Categories

Centralization / Privilege

Centralization / Privilege findings refer to either feature logic or implementation of components that act against the nature of decentralization, such as explicit ownership or specialized access roles in combination with a mechanism to relocate funds.

Coding Style

Coding Style findings usually do not affect the generated bytecode but rather comment on how to make the codebase more legible and, as a result, easily maintainable.

Volatile Code

Volatile Code findings refer to segments of code that behave unexpectedly on certain edge cases that may result in a vulnerability.

Logical Issue

Logical Issue findings detail a fault in the logic of the linked code, such as an incorrect notion on how block.timestamp works.

Checksum Calculation Method

The "Checksum" field in the "Audit Scope" section is calculated as the SHA-256 (Secure Hash Algorithm 2 with digest size of 256 bits) digest of the content of each file hosted in the listed source repository under the specified commit.

The result is hexadecimal encoded and is the same as the output of the Linux "sha256sum" command against the target file.

About

DeHacker is a team of auditors and white hat hackers who perform security audits and assessments. With decades of experience in security and distributed systems, our experts focus on the ins and outs of system security. Our services follow clear and prudent industry standards. Whether it's reviewing the smallest modifications or a new platform, we'll provide an in-depth security survey at every stage of your company's project. We provide comprehensive vulnerability reports and identify structural inefficiencies in smart contract code, combining high-end security research with a real-world attacker mindset to reduce risk and harden code.
